

PCB seminars & workshops

In 2014, Azitech expanded its business with an event department. The event department is responsible for creating and executing multiple events, seminars, and workshops throughout the year.

Azitech wants to create an educational platform for PCB designers in all of Europe that has the best instructors, the best content, and that offers the best learning experience for all the participants. The focus is on PCB designs and how to optimize these in the future by use of the newest technology.

So far, Azitech has created seminars on HDI technology, signal integrity, EMI, and noise. In 2015, Azitech expanded again and added a hands-on HDI workshop, where PCB designers, in practice, can learn how and when to use HDI techniques correctly. More hands-on workshops will be added over time.

If you have an idea for a seminar or workshop, feel free to contact us.

The events have been a huge success and Azitech is continuously exploring new technologies that could improve PCB designs in the future.

The seminars and workshops are not only highly informative and educational; they also allow for sparring and networking with other PCB designers. Azitech always hosts a networking dinner for the participants on the evening of the first event day.

This is a perfect opportunity for the participants to get to know each other and network in an informal setting.

This is also a chance to talk to the instructors and get guidance from them. All instructors are considered "gurus" in their field, so the participants will get a unique chance get assistance from some of the best in the field of PCB design.
